### 4.4 The Shape Of A Graph Part 1

Concavity: The graph of  $f$  is concave upwards if  $f'$  is increasing and concave downwards if  $f'$  is decreasing.

Concave Up

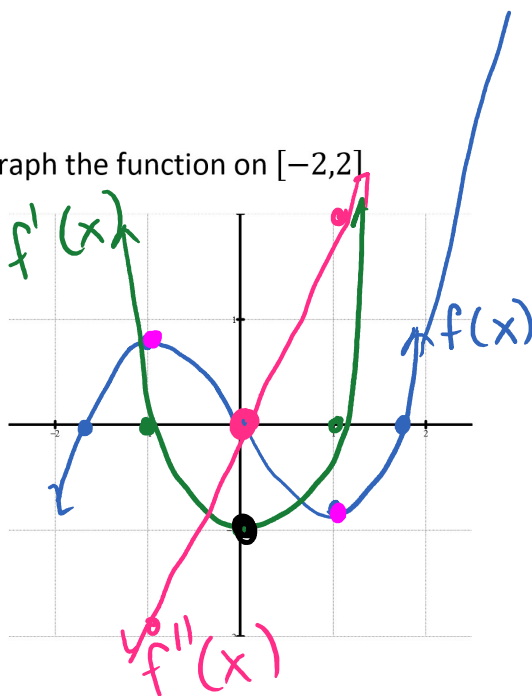

Makes a cup  
left  $\rightarrow$  right  
 $f'(x)$  is increasing  
Tangent lines below  
the graph of  $f(x)$

Concave Down

Makes a frown  
left  $\rightarrow$  right  
 $f'(x)$  is decreasing  
Tangent lines  
above the graph of  
 $f(x)$

#1  $f(x) = \frac{1}{3}x^3 - x$  Graph the function on  $[-2, 2]$

a) Concavity of the function

concave up

$$x > 0$$

concave down

$$x < 0$$

b) Relationship of the zeroes of  $f'(x)$  and the function

$$f'(x) = x^2 - 1 \quad x = \pm 1$$

$$0 = x^2 - 1$$

$$1 = x^2$$

When  $x = 1$   $x = -1$   
 $f(x)$  has a max  
 or a min

c) Relationship of the zeroes of  $f''(x)$  and the function

$$f''(x) = 2x$$

$$0 = 2x$$

$$0 = x$$

When  $x = 0$   
 $f(x)$  changes concavity

d) Relationship of the zeroes of  $f''(x)$  and the first derivative

zeros of  $f''(x)$

$$x = 0$$

When  $x = 0$   
 $f'(x)$  has a minimum

Test for Concavity:

$f''(x) > 0$  (positive)  $f(x)$  is concave up

$f''(x) < 0$  (negative)  $f(x)$  is concave down

#2  $f(x) = \frac{x^2+1}{x^2-4}$  Determine the concavity of the function.

$$f'(x) = \frac{(x^2-4)(2x) - (x^2+1)(2x)}{(x^2-4)^2}$$

$$f'(x) = \frac{2x^3 - 8x - 2x^3 - 2x}{(x^2-4)^2}$$

$$f'(x) = \frac{-10x}{(x^2-4)^2}$$

$$f''(x) = \frac{(x^2-4)^2(-10) - (-10x)(2)(x^2-4)(2x)}{(x^2-4)^4}$$

$$f''(x) = \frac{-10(x^2-4)[x^2-4 - 4x^2]}{(x^2-4)^4}$$

$$f''(x) = \frac{-10[-3x^2-4]}{(x^2-4)^3}$$

$$f''(x) = 0$$

Numerator = 0

$$-3x^2 - 4 = 0$$

$$x^2 = -\frac{4}{3}$$

Never

$$f''(x) \text{ undefined}$$

Denominator = 0

$$x^2 - 4 = 0$$

$$x^2 = 4$$

$$x = \pm 2$$

$$(-\infty, -2) \quad (-2, 2) \quad (2, \infty)$$

$x = -3$                        $x = 0$                        $x = 3$

sign  
 $f''(x)$

(+)

(-)

(+)

concave up  $(-\infty, -2)$  and  $(2, \infty)$   
concave down  $(-2, 2)$

Points of Inflection:

If the tangent lines to the graph exist at a point where the graph changes concavity, then the point is called an inflection point. If  $(c, f(c))$  is an inflection point of  $f$ , then either

$$f''(c) = 0 \text{ or } f''(c) \text{ is undefined}$$

#3 Find the points of inflection if  $f(x) = x^4 - 4x^3$

$$f'(x) = 4x^3 - 12x^2$$

$$f''(x) = 12x^2 - 24x \quad *$$

$$0 = 12x^2 - 24x$$

$$0 = 12x(x - 2) \quad *$$

$$x = 0 \quad x = 2$$

$$(-\infty, 0) \quad (0, 2) \quad (2, \infty)$$

$$x = -1$$

$$x = 1$$

$$x = 3$$

⊕

⊖

⊕

concave  
up

concave  
down

concave  
up

Need y-values

$$x = 0 \quad f(0) = 0^4 - 4(0)^3$$

$$f(0) = 0$$

$$x = 2 \quad f(2) = 2^4 - 4(2)^3$$

$$f(2) = 16 - 32$$

$$f(2) = -16$$

Inflection points at  $(0, 0)$  and  $(2, -16)$   
due to a change in concavity.
