5.2 Slopes of Parallel and Perpendicular Lines

Slope of Parallel Lines

Parallel lines never cross.

Parallel lines have the same Slope.

Example 1 : The line AB passes through the points $A(-3, 5)$ and $B(-6, -4)$. The line CD passes through the points $C(5, 4)$ and $D(2, -5)$. Graph the points. Are the lines parallel? Justify your answer.

x_1, y_1 x_2, y_2

slope AB

$$m = \frac{y_2 - y_1}{x_2 - x_1}$$

$$m = \frac{-4 - 5}{-6 - (-3)}$$

$$m = \frac{-9}{-3} = 3$$

slope CD

$$m = \frac{-5 - 4}{2 - 5}$$

$$m = \frac{-9}{-3} = 3$$

They are parallel
Same Slope

Example 2 : Determine if the quadrilateral is a parallelogram.

Using
rise
run

Quadrilateral : 4 sided shape

Parallelogram : 2 sets of parallel sides
(opposite sides parallel)

$$AB = \frac{-6}{3} = -2$$

$$BC = \frac{5}{2}$$

$$CD = \frac{-6}{3} = -2$$

$$AD = \frac{5}{2}$$

$AB \parallel CD$ and $BC \parallel AD$
So $ABCD$ is a parallelogram

Example 3: The line CA passes through the points $A(-3, 5)$ and $C(0, 0)$. The line CB passes through the points $B(5, 3)$ and $C(0, 0)$. Graph the points. What is the relationship between slopes of CA and CB ?

Slope AC
 $m = -\frac{5}{3}$

Slope BC BC
 $(5, 3)$ $(0, 0)$
 x_1, y_1 x_2, y_2

$$m = \frac{0 - 3}{0 - 5}$$

$$m = -\frac{3}{-5} \div (-1)$$

$$m = \frac{3}{5}$$

AC is perpendicular to BC
 $AC \perp BC$

$$-\frac{5}{3} \cdot \frac{3}{5} = -\frac{15}{15} = -1$$

Slopes of Perpendicular Lines

Two perpendicular lines form a Right angle 90° angle

The product of the slope of two perpendicular lines is -1.

For two perpendicular lines, the slope of one is the negative reciprocal of the other.

Example 4: For each slope below, indicates the slope of a perpendicular line.

a) $\frac{2}{3}$
 pos $-\frac{3}{2}$
 neg

b) $-\frac{3}{4}$ = $-\frac{3}{4}$ negative

$\frac{4}{3}$ positive

c) $-\frac{5}{1}$ neg

$\frac{1}{5}$ pos

Intercepts : X-Intercept and Y-Intercept

X-Intercept – The point where the graph crosses the horizontal axis.

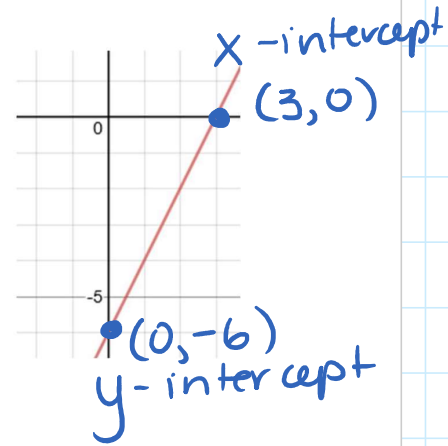

The x-intercept is the value of "x" when "y" equals zero.

$$(x, 0)$$

Y-Intercept – The point where the graph crosses the vertical axis.

The y-intercept is the value of "y" when "x" equals zero.

$$(0, y)$$

Example 5 : What is the relationship between the lines (parallel, perpendicular, or neither)? Justify your answer.

Line **AB** x-intercept is 4 and the y-intercept is 6.

Line **CD** x-intercept is 3 and the y-intercept is -2.

$$\begin{array}{l} \text{AB} \\ A(4, 0) \\ B(0, 6) \end{array}$$

$$m = \frac{\text{rise}}{\text{run}}$$

$$m = \frac{-6}{4} \div 2$$

$$m = -\frac{3}{2}$$

$$\begin{array}{l} \text{CD} \\ C(3, 0) \\ D(0, -2) \end{array}$$

$$m = \frac{y_2 - y_1}{x_2 - x_1}$$

$$m = \frac{-2 - 0}{0 - 3}$$

$$m = \frac{-2 \div (-1)}{-3 \div (-1)}$$

$$m = \frac{2}{3}$$

$$-\frac{3}{2} \cdot \frac{2}{3} = -\frac{6}{6} = -1$$

$$AB \perp CD$$

Practice : p.348 #3 – 6, 8ab, 9cd, 10, 13
