## 6.1 – Solving Systems of Equations Graphically – Part 1

A linear equation system: two linear equations that have the same two variables.

The solution of a linear equation system: The point of intersection, or ordered pair, of the two linear equations represents the solution.

$(x, y)$

**Example 1 :** Determine the solution to the linear system.

$(-2, 3)$

**Example 2 :** Solve each linear system graphically.

①  $y = -\frac{2}{3}x + 1$  and ②  $y = x - 4$

$m = -\frac{2}{3}$

$b = 1$

slope =  $-\frac{2}{3}$

①

b)  $3x + 2y = -12$  and  $-2x + y = 1$

$\frac{2y}{2} = \frac{-3x - 12}{2}$

$y = -\frac{3}{2}x - 6$

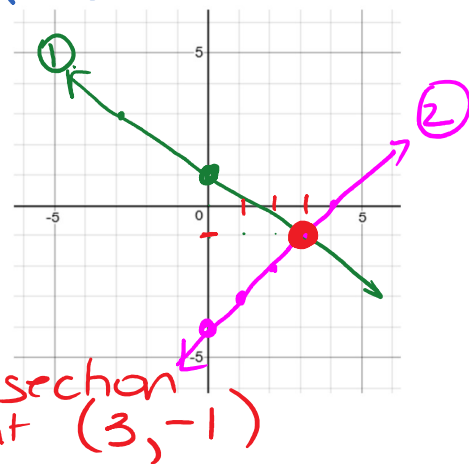

slope =  $m = -\frac{3}{2}$

$y_{int} = b = -6$

Mrs. Shaw

$y = mx + b$

intersection point  $(3, -1)$

intersection point  $(-2, -3)$

F & PC 10

①

c)  $-2x - 6y = -6$  and  $x - y = 3$

Rewrite as  $y = mx + b$   
Slope intercept form

$$\textcircled{1} \quad -2x - 6y = -6$$

$$\quad \quad \quad +2x \quad \quad \quad +2x$$

$$\frac{-6y}{-6} = \frac{2x - 6}{-6}$$

$$y = \frac{2}{-6}x - \frac{6}{-6}$$

$$y = -\frac{1}{3}x + 1$$

y-int = 1

Slope =  $-\frac{1}{3}$     ↓ 1 → 3

$$\textcircled{2} \quad x - y = 3$$

$$\quad \quad \quad -x \quad \quad \quad -x$$

$$\frac{-y}{-1} = \frac{-x + 3}{-1}$$

$$y = 1x - 3$$

y-int = -3

Slope =  $1 = \frac{1}{1}$     ↑ 1 → 1

intersection point  
(3, 0)
